One problem with previous websites is that their colour scheme wasn't very good. Different websites had different problems, but they could all be more aesthetically pleasing. We made our website look better by doing the following:

1. Pale grey background instead of bright white.
2. Nice looking link colours and different colours for unclicked, hovered, active, and clicked links.
3. A header and footer.
4. Alternating background colours for each week for assignments, labs, and lecture materials.

I also think it's better to have many unique pages on a site instead of one unique page that has all the information you need. That way it is easy to find the information you want on its unique page, instead of getting lost scrolling. Even with links that take you to a section of a larger page you want, I still think it's easy to get lost.

Another problem the other websites had is that they did not necessarily look good on mobile. We used Viewport and flex boxes so everything looks nice on mobile.

A problem we faced was being able to share files easily because we would not meet up in person often. We decided to use Github, and Github made working together

much easier. We also used Facebook messenger for communication, because you can use it to chat via laptop or phone.

Another problem was having to edit across multiple files when we would want to change something common to all files, like the header or footer. But the editor Notepad++ has a “find and replace across all files” button that was almost as good as actual inheritance for editing.
